### **Bills of Material Cost Rollups**

In a standard cost manufacturing environment, the rollup of standard material and labor costs within bills of material is a required feature. The Info.Net bill of material rollup will calculate manufactured items costs for any number of standard cost environments, including the full suite of fifteen individual cost elements for both the single level values and for elemental values. If routings are defined, the manufactured item costs will be computed at the operation level.

If alternate bills of material or routings have been defined, a cost rollup may be made through a user specified set of alternate bills and / or routings.

In addition to calculating standard cost, the rollup procedure also calculates assembly time fences.
