### **Coproduct / Byproduct Definitions**

A coproduct is a product that is usually manufactured together or sequentially with another item because of product or process similarities. The coproduct is defined under an assembly bill of material including a multiplier to align the coproduct quantities with the assembly primary part number. The coproduct will be considered an acceptable receipt for work orders based on the assembly's primary part number.

A byproduct is material of value produced as a residual of, or incidental to, the production process and can be defined in the Info.Net bill of material, specifying the operation sequence at which the byproduct will be available. Defined byproducts are considered in the standard cost calculations.
