Customer Owned Material Control

Customer owned material that is brought into a user's facility can be of two types:

- Each customer supplied item may be unique to a specific customer
- The item may be common among multiple customers

If the item is to be supplied by multiple customers, the item can be isolated in a no cost location that will be created for the use of the specific customer. As the material is owned by a customer (as with a unit returned by a customer for repair), none of the movements of the item will impact the user's cost system or the user's inventory value.

If the item is unique to a customer, the customer code can be assigned to the item at the time that the item is initially defined and can be stored in any inventory location. As described above, items of this type will have no cost or inventory value implications.
