Engineering Change Control

Revision control can be maintained throughout the Info.Net system without full engineering change control but, if required, engineering changes can be created that will define and track the implementation of any number of line items within a specific engineering change.

The creation of the engineering change will create pending change records in the bills of material that will be incorporated into the MRP planning process. And the implementation of each of the engineering change line items will create a revision to the pending bill of material revision that will incorporate the change into the current bill of material.
