**SPECIALISTS IN BUSINESS CONTROL SYSTEMS**

### **Externally Owner Material Control**

If customers are supplying material for use in subcontract orders, Info.Net is able to differentiate between customer owned material and internally owned material, and will not attempt to include the value of the customer material in the inventory valuation or include the movement of the customer owned material in the period closing calculations.

All of the externally owned material is pegged to the specific supplying customer and all of the transactions related to this material will note the owning customer.
