Flexible Application Security

The INFO.NET permission system ensures that only authorized users will be able to run INFO.NET programs. It allows you to control which users, or groups of users, will have access to which programs.

A user will see only the programs that he has access to on his menu screens. This feature makes the system convenient to use because users will know they can run all programs that appear on their menus. It also serves as an added security feature because users won't be tempted to access programs they don't know exist. Because of this, however, a menu may appear differently between users, depending on permission levels and the names of the menus to which the user has been given access.

Each user is assigned a security permission entry from 1 to 99 and a security group and each program within the system also has a security entry from 1 to 99 and a security group. So in addition to the ability to control the user's access to programs through modification of the system menus, the security level of the user and the program will also be compared to determine if the user is to have access to a program.
