### **Inventory Cycle Counting / Physical Inventory System**

The cycle counting system provides a simple method for counting important inventory items and correcting inventory levels in a logical, orderly fashion. Following the assignment of ABC cycle count codes to all of the inventory items, the cycle count system will present a list of items that require counting on a daily basis.

The physical inventory system runs within the cycle count system, but prepares a listing of all inventory items to be counted at one time, rather than on a cyclical basis.
