Inventory Item Revision Control

The Info.Net system provides the user the option of maintaining revision control over all inventory items. If revision control is not in use, no references to part number revisions will be seen on the system's screens, but if revision control is in use, every part number entry will be accompanied by a revision field. An exception is in the sales order definition where the default will be to sell and ship the oldest revision of an item currently in inventory. This, however can be overridden by the entry of a valid revision during sales order entry.

All inventory quantities will be segregated by item revision and all transactions will refer to specific item revisions.

When moving up from revision to revision, the system will maintain the link between revisions by the use of effective dates, and all pertinent data records (such as bills of material) will be rolled forward when new revisions are created for a specific part number.

If required, a full engineering change control system can be used to control and update part number revisions.
