Item Attribute Inventory Control

In the assignment of user defined attributes to inventory items, the user will be asked if the attribute will be used for inventory control purposes. If, for example, an attribute assigned to an item is 'color' – of which there are three acceptable values – red, white and blue – the resulting inventory of this item will be controlled by 'color'. All transactions of the inventory will require the entry of the 'color' to be transacted. The reported inventory quantities will also be subdivided down to the color level.

In addition to the tracking of the inventory quantities down to the item attribute level, each attribute can also be assigned an incremental cost amount or percentage, which can be used to augment the item standard cost for specific attributes.
