Item Attribute Testing / Quality Control

Attributes assigned to inventory items can be defined as testable attributes in either receiving inspection (for purchased items) or at shop floor work centers (for production items). The test can specify a mandatory reject if the test results fail to meet the attribute limits, or the test can be defined as an optional reject, leaving the actual reject up to the user's discretion.

The system will track the results of both acceptable and unacceptable tests and can provide data to a control charting process.
