

## **Jump / Drill**

As an option in most of the system programs, the user will see a button labeled 'JUMP / DRILL'. This option will produce a listing of predefined programs that may be directly accessed from the parent program. The valuable aspect of this capability is the ability to leave a partially completed function (e.g. defining a new sales order), examine a customer definition, and then return to the sales order entry routine without losing any data in the original program.

The user has the ability to revise the predefined jump program list at any time, and every user of the system can be given access to their own customized jump program list.

In addition to the predefined list of jump programs, the system defined jump definitions contains an additional program that permits the user to jump to any system program (provided that the proper level of security is available) through the direct entry of the program name, a match on a program alias, a match on a portion of a program description or a match on a keyword entry.
