

## **Multiple Automatic Sales Order Scheduling Algorithms**

Every saleable part number has an option of five automatic scheduling algorithms that can run during the various sales order entry routines:

- Based on Available to Promise date (ATP) or lead time (whichever is earliest)
- Based on Capable to Promise date (CTP) or lead time
- Based on Available to Promise (ATP) or time fence
- Based on Capable to Promise (CTP) or time fence
- Single level finite plan (manufactured items only)

The calculated schedule date will also include the number of user-defined order processing days.

Although the sales order entry programs will suggest a ship date, the user will still have the option of overriding the automatically generated date.
