

Preventive Maintenance Tracking and Scheduling

If required, each tool or machine can have a preventive maintenance schedule algorithm defined. Once available, the system will produce a listing of the tool or machines scheduled for preventive maintenance between user specified dates.

The preventative maintenance type codes include:

- Hours of use. The shop floor transactions are required to produce the data that can be used to schedule this type of preventive maintenance
- Processed units. As above, the shop floor transactions are required to produce the data that can be used to schedule this type of preventive maintenance.
- Number of days between preventive maintenances.
- Day of month. The number of months between maintenance work will be requested.
