Purchase Order History

None of the records associated with purchase orders, purchasing requisitions or receiving transactions will be deleted from the database except through the data purge routine, which works on the basis of maintaining as many months of historical data as the user wishes to hold on line.

Purchase orders and purchase requisitions themselves can be deleted from the database if no activity is found against the order. This is desirable to correct errors in data entry, but no purchasing record that is pertinent to the user's operation can be deleted.

In addition to protection against the removal of data records, the system will, optionally, track changes to purchase order line items, schedule dates, schedule quantities and prices. These edit transactions will also record the reason code and user identifier of the individual making the change.
