Purchase Order Receiving Control

The receiving transaction system can receive material at any number of previously defined warehouses or locations and, if required, can include any number of receiving inspections tests for incoming material.

The actual receiving transaction program has the ability to receive entire orders with a single entry or to receive individual partial shipments of any quantity. The receiving transaction will generate accounting entries related to the actual material movement and will generate a purchase price variance accounting transaction if a variance is seen by the transaction routine. Each receiving transaction entry also includes an optional receiver identifier, an optional bill of lading entry and carrier name.

The transactions can use multiple units of measure and will handle incoming vendor lot numbers or serial numbers, retaining these entries for future reference. If incoming material is under warranty, the warranties will also be recorded and will be made available for future use, including reshipment to customers.
