Receiving Inspection Quality Control

Any number of testable attributes can be defined for a part number, including specific required values or ranges of quantifiable numeric limits. Each of these tests are required prior to the actual acceptance of the units into inventory, and the test definition includes a choice of mandatory or optional rejection if the test result are not acceptable.

If an optional reject is specified, the program will ask the user entering the test results if the item is to be rejected or accepted.

The results of the test, including both the original test specifications and the results are held in a receiving inspection test table and can be queried or listed using various sorts, including vendor, part number, test attribute code or order number.
