Recurring Journals

The general ledger module contains a function that permits the user to enter fixed-amount transactions that occur every period. The user can specify the number of periods over which the recurring journal entry is to apply. This is a shorthand method for entering repeated fixed-amount journal entries.

As with a standard journal, each recurring journal can have any number of transactions to any number of accounts and the journal must balance before it can be processed.

Recurring journals can have user or system assigned journal numbers.
