Standard / Planned Cost Control

Even though Info.Net will track actual cost, its cost accounting system is based on standard cost. Taken from any number of user defined standard costs, updates to standard cost are done in a controlled environment, producing adjustments to inventory values.

In a manufacturing environment, the standard cost rollup will produce cost at the level of routing operations, permitting the accurate valuation of the work in process.

Info.Net will maintain a history of standard costs, and all inventory activity history will be valued at the standard cost at the time of the transaction.
