User Defined System Messages

The text presented to the user as warning messages, error messages and button text in the system screens can be revised by the user by entering a revised message with the same identifying name into the user's message table. This enables the user to disable program functions by removing a specific function name from the list of program buttons if required, or revising program error or warning messages.

This level of system message editing can be directed to specific organizations or to specific employees if required.
