

Work Order Variance Reporting

Work order variances will be taken at the time that the work is closed. Potential variances can be seen at any time during the run of the order. Repetitive schedules will have their variances calculated at the point where their scheduled output changes, although the repetitive schedule variances can also be queried at any time.

The variances tracked include:

- Material and material burden
- Internal and subcontracted labor
- Labor overhead
- Setup labor and overhead
- Rate variances for both personnel and machines
